Faculty Guide: SANDIP KAHATE

Made with GAMMA

College events become easier to manage in one place

Event details

Store and update college events.

Student details

Keep student information together.

Registrations

Connect students with selected events.

One application replaces scattered manual records and helps users view and update information quickly.

Made with GAMMA

Manual event management takes time and creates confusion

When records are spread across paper and separate files, small mistakes become harder to see.

Example: a student may be in one file, while the registration status is kept somewhere else.

> Finding the latest registration status should not require checking several places.

Hard to update

Paper or separate files change slowly.

Hard to find

Student and event records take extra time to locate.

Easy to miss

Duplicate entries and missed registrations can happen.

Made with GAMMA

Our project keeps the registration process simple

Four actions cover the main working flow.

01

Add events

Manage college event details.

02

Manage students

Add and update student details.

03

Register

Connect a student to an event.

04

Maintain records

View, update, or delete records.

The same application supports the full registration process.

Made with GAMMA

Four technologies work together

Each technology has a clear role in the application.

Python

Builds the main application logic.

Streamlit

Creates the simple web interface.

SQLite

Stores the project data locally.

SQL

Adds, views, updates, and deletes records.

Made with GAMMA

The system manages three connected types of information

Events

Create, view, update, and delete event details.

Students

Add and manage names, emails, departments, and study years.

Registrations

Connect a student to an event and manage the registration status.

Use screenshots to show the real screens and only the features visible in the application.

Made with GAMMA

A simple flow connects the user to the stored data

User → Streamlit Application → SQLite Database → Display Results

User

Streamlit Application

SQLite Database

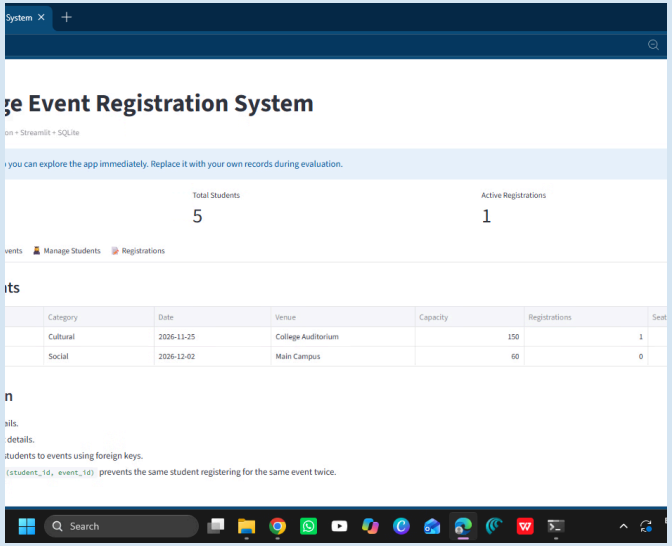

Display Results

Example: a user selects a student and event, saves the registration, and sees the updated record.

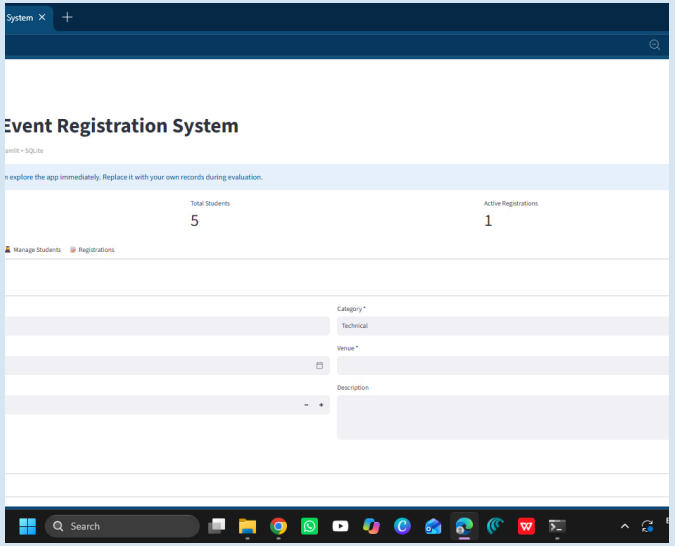

Made with GAMMA

The application screens show the working project

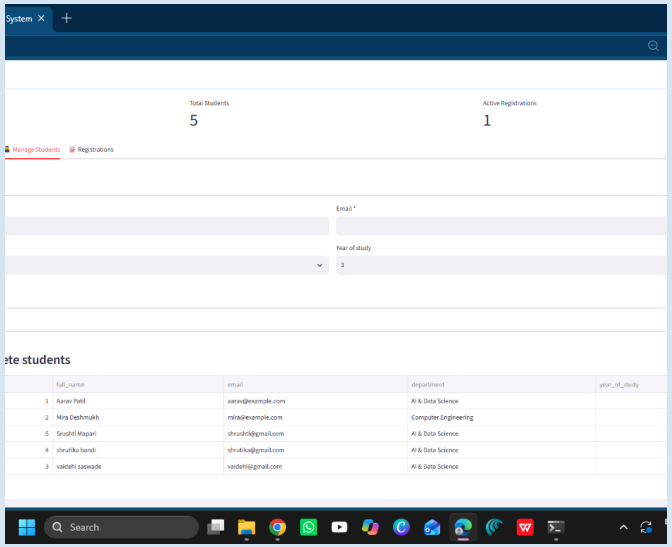

Four core screens from the working project, shown in order.

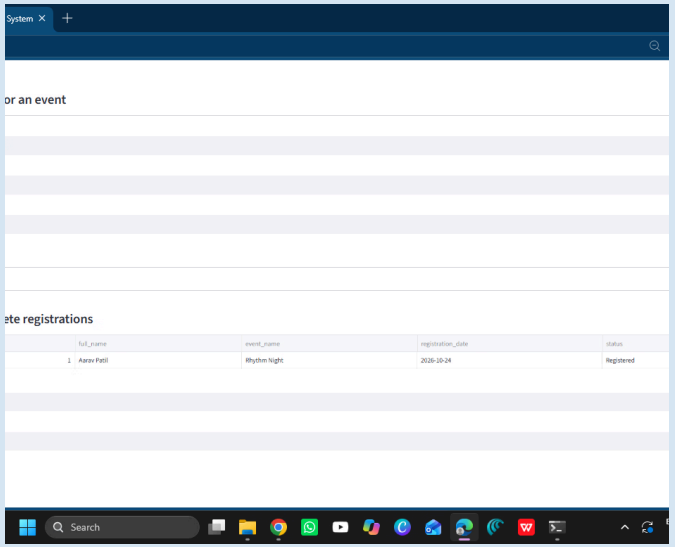

Dashboard overview

Create events

Manage students

Register stud

Made with GAMMA

Testing confirmed the main working flow

The team reports testing all implemented functions.

Area	What testing showed
EVENTS	Records can be viewed and managed.
STUDENTS	Student details can be viewed and managed.
REGISTRATIONS	Registration records can be viewed and managed.

> One place makes records easier to find, update, and explain.

No performance numbers are claimed because none were measured.

Made with GAMMA

CONCLUSION

One simple system brings the full process together

Clear interface: The project combines a clear Streamlit interface with a local database.

Organized data: Events, students, and registrations stay connected.

Future improvements: Login roles, attendance tracking, notifications, reports, and cloud hosting.

Thank You
